UP TO 90% OF PEOPLE WHO TEST POSITIVE FOR COVID BARELY CARRY ANY VIRUS & ARE NOT CONTAGIOUS. EVERY STAT ABOUT THE DISEASE IS BOGUS.

Top US virologists have been stunned by revelations about the laxity of the US Covid testing regimen. It turns out that tests that deliver a simple binary "*positive or negative*" result are not fit for purpose, as they tell us nothing about the contagiousness of each person.

Up to 90 percent of people who have tested positive should actually have been negative, as they are carrying only tiny amounts of the virus, are not contagious, pose no risk to others, and have no need to isolate.

Most testing companies have chosen the outrageously high sensitivity limit of 40 PCR cycles - meaning that the DNA in a sample is exponentially increased 40 times in order to amplify its signal...
